

Role of the Cloud in the Future of Robotics

Roger S. Barga

GM, AWS Robotics

Mobile Robotics

We are at an inflection point
Expected growth in the use of
mobile robots will increase by
almost tenfold over the next two
to three years

Explosion in the number of mobile robots in use (total number of units)

Mobile Robotics

By
2023

it's estimated that mobile autonomous robots will emerge as the standard for logistic and fulfillment processes

By
2030

70% of all mobile material handling equipment will be autonomous

The Pull of Economics

Modern Automation in Warehouse

- Autonomous robots
- Robots search for items, bring to a human
- Robots co-ordinate to achieve a system goal
- Many orders fulfilled simultaneously
- Increases productivity
- Maximizes throughput

System Layout

Green: Storage Area

Orange: Mobile Robots

Blue: Stations

Kiva Robots and Pods

and yet...

Cost breakdown of a robotic work cell

Where does the time go?

Days spent setting up and configuring

Many prototyping iterations

Requires machine learning expertise for intelligent functions

Months to building a realistic simulation environment

Duplicated efforts integrating an application management system

AWS RoboMaker

DevOps for Robotics

A service that makes it easy for developers to develop, test, and deploy robotics applications, as well as build intelligent robotics functions using cloud services

Robot Operating System (ROS)

Most widely used software framework for teaching and learning about robotics – over 16 million .deb (Linux Debian) packages downloaded in 2018, a 400% increase since 2014

Founded in Stanford labs over 10 year ago, now managed by the Open Source Robotics Foundation (OSRF)

Global open-source community supports two products—Robot Operating System (ROS) and Gazebo

ROS

A set of software libraries and tools, from drivers to algorithms, that help developers build robot applications

Gazebo

Robust physics engine, high-quality graphics, and programmatic and graphical interfaces to help developers simulate robots

ROS 2 Technical Steering Committee

Robot Operating System (ROS)

Why ROS 2?

Designed for Production

Drawing on a decade of experience establishing ROS 1, ROS2 was built from the ground up to be used in production, including high reliability and safety critical systems.

Robot Operating System (ROS)

Why ROS 2?

Designed for Production

Multi-Platform

ROS2 has first class support for Linux, Windows, and macOS. Allows for ports to new platforms, such as real-time and embedded OSs.

Robot Operating System (ROS)

Why ROS 2?

Designed for Production

Multi-Platform

No Vendor Lock-In

ROS2 middleware (rmw) layer at the core of ROS2 embodies key abstractions required for a distributed system based on publish-subscribe semantics.

Robot Operating System (ROS)

Why ROS 2?

Designed for Production

Multi-Platform

No Vendor Lock-In

Built on Open Standards

Communications method in ROS2 use industry standard DDS and RTPS, both widely deployed in a variety of industrial applications, from factories to space.

Robot Operating System (ROS)

Why ROS 2?

Designed for Production

Multi-Platform

No Vendor Lock-In

Built on Open Standards

Permissive Open Source License

ROS2 licensed under Apache 2.0 License, with ported ROS1 code under the 3-clause (or “new”) BSD License.

Robot Operating System (ROS)

Why ROS 2?

Designed for Production

Multi-Platform

No Vendor Lock-In

Built on Open Standards

Permissive Open Source License

Cloud Extensions for ROS

Simulation

Fleet
Management

AWS RoboMaker

Development Environment

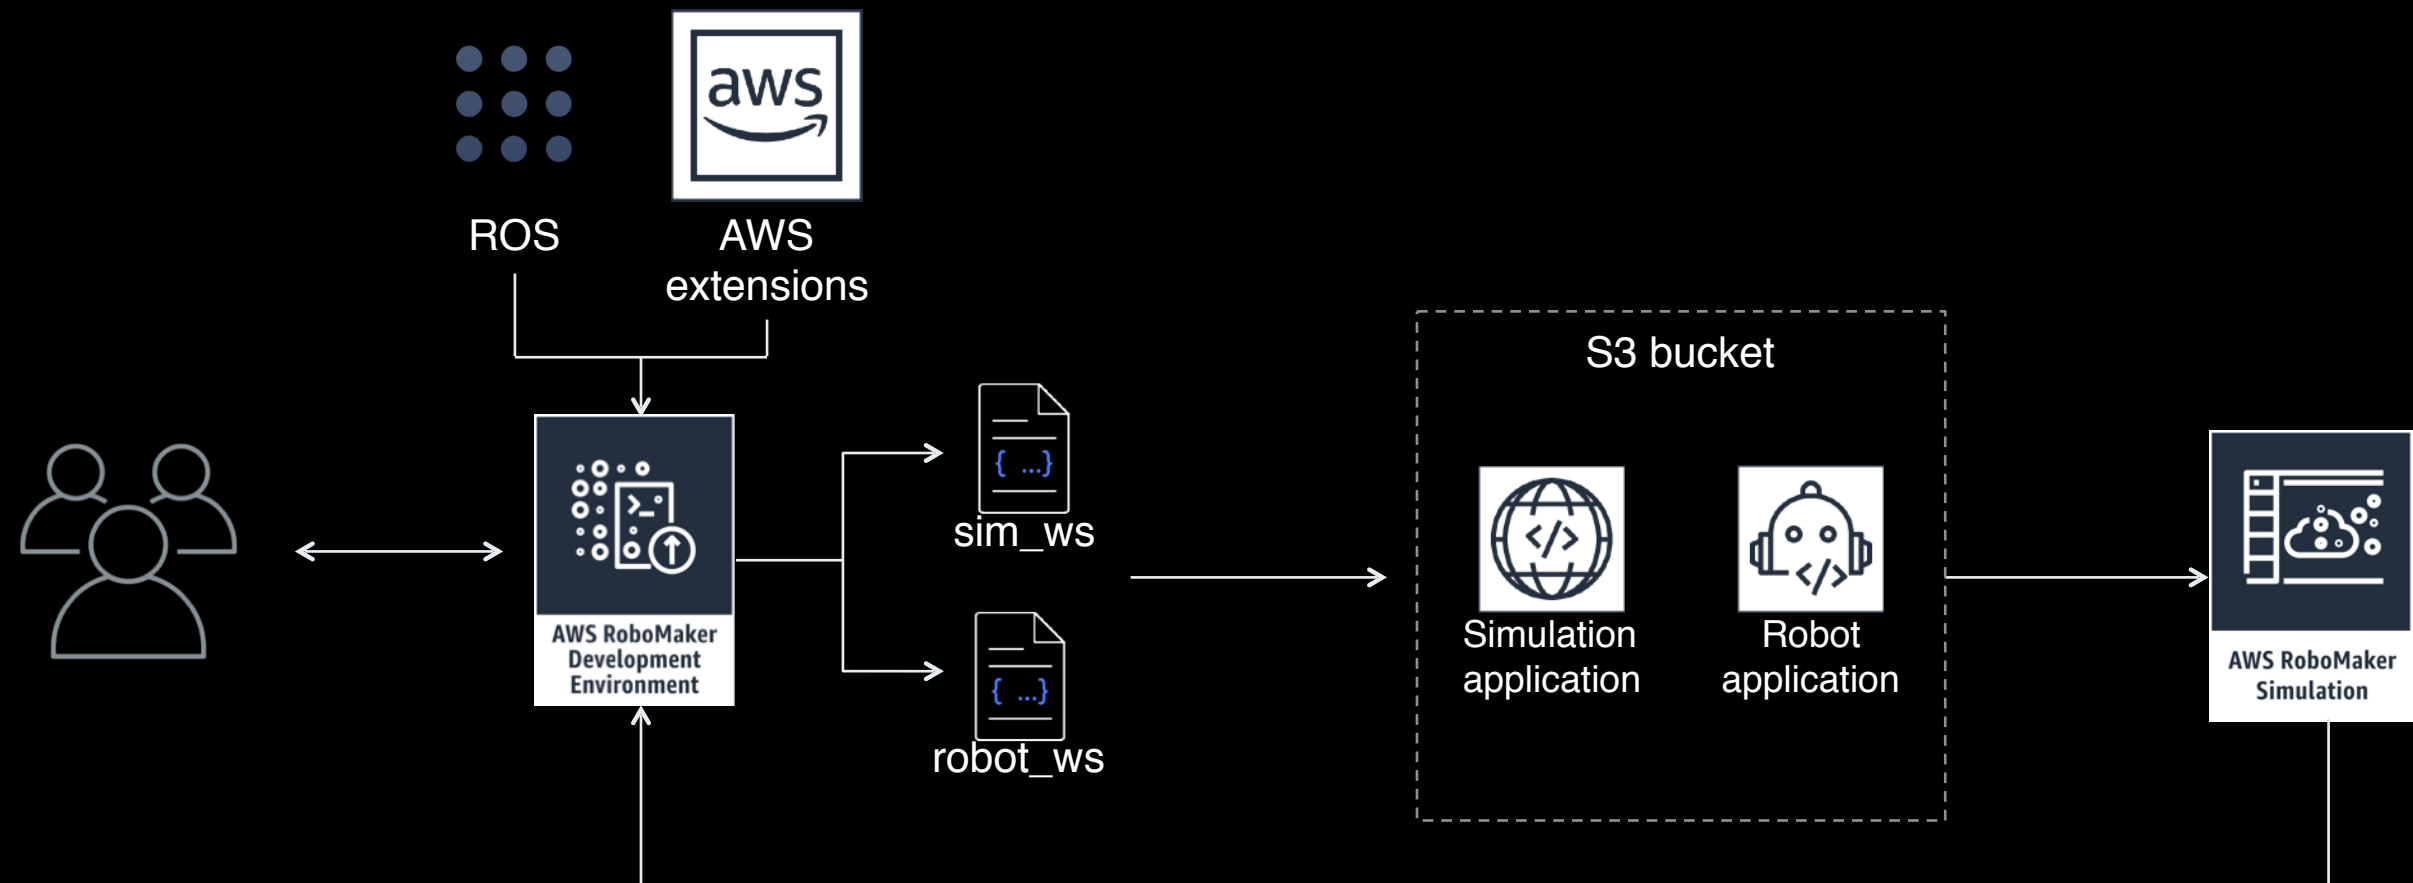

- ❖ Start development with zero setup effort
- ❖ Create a RoboMaker development environment with a single click of a button
- ❖ Includes pre-installed RoboMaker cloud extensions and sample robotics applications
- ❖ Automatic download, compile and configuration of operating system, development software, and ROS

AWS RoboMaker

AWS RoboMaker

Cloud Extensions for ROS

Cloud extensions written as ROS packages automatically create connections and make API calls to AWS services, such as Amazon Lex, Amazon Polly, Amazon Kinesis Video Streams, Amazon Rekognition, and Amazon CloudWatch

LEX
speech
recognition

POLLY
speech
generation

KINESIS
VIDEO
STREAMS
video streams

REKOGNITION
image and video
analysis

CLOUDWATCH
logging and monitoring

 72 Sensors

 Low-end CPU

 Cloud support

 Redundancy & Safety

 Open source ROS & **ROL**

 End-to-End custom design

Cloud Powered Future

RoboMaker: Simulations and parameter tuning

RoboMaker-Kinesis: Real-time data streaming

RoboMaker-Lex-Polly: Enhanced interactivity

EC2/S3: Remote portal and Deployment

Analysis: Walking gait of patient

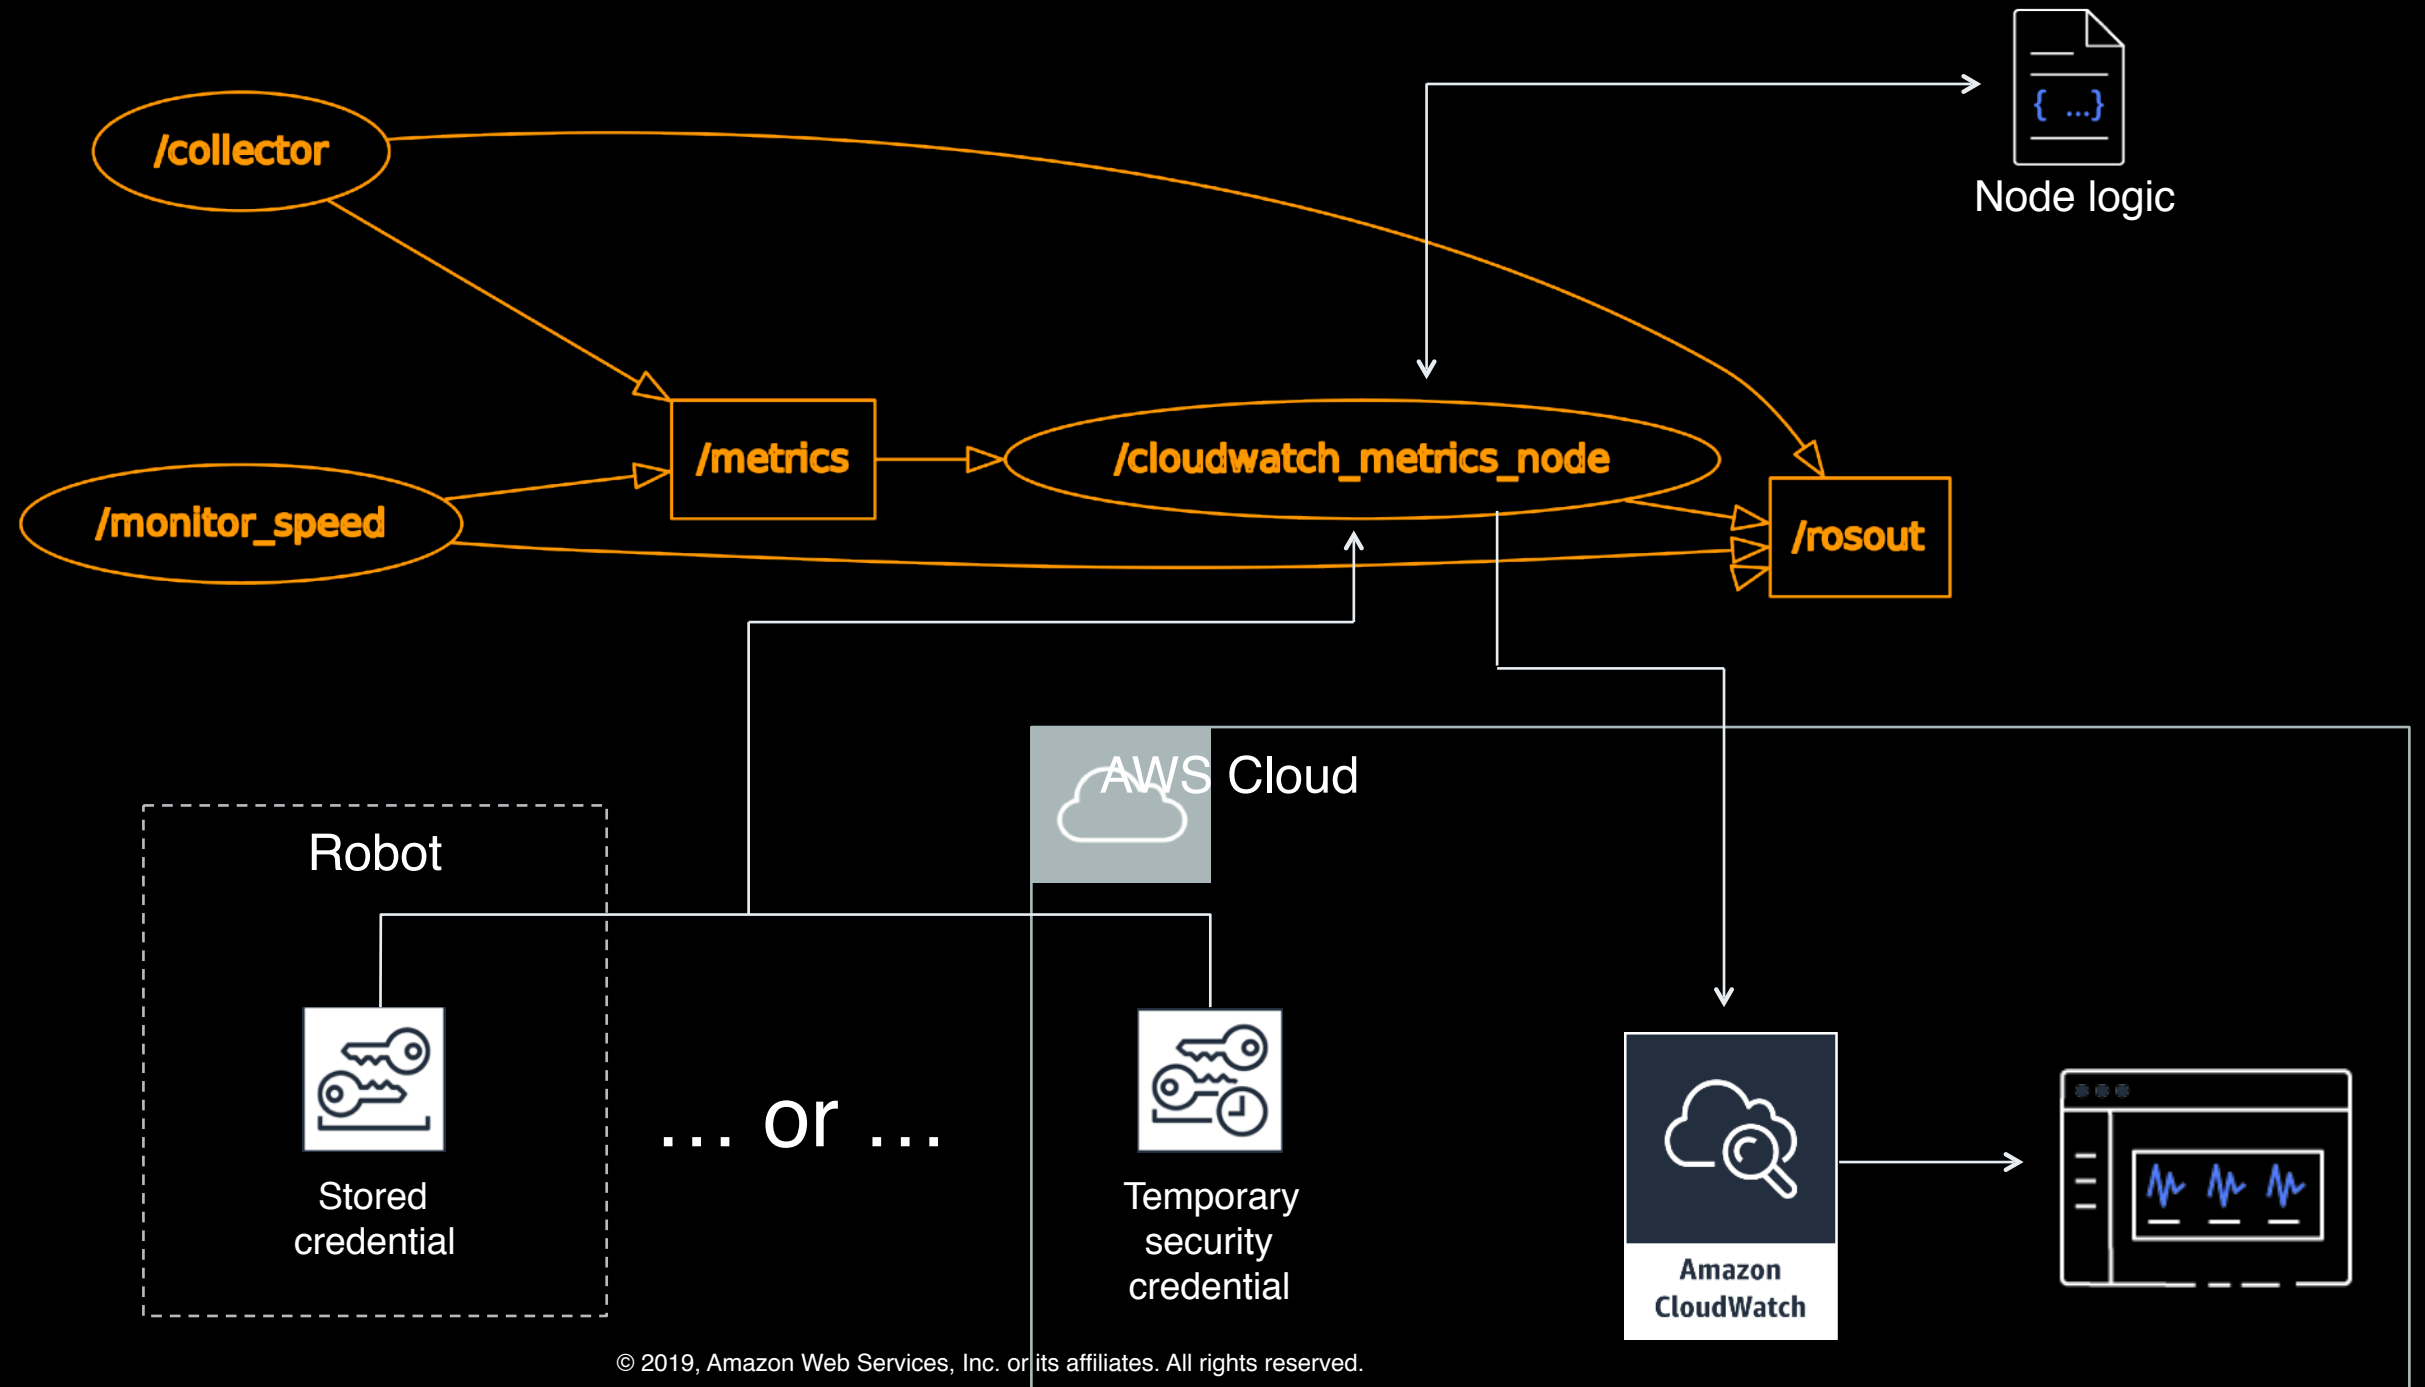

Prediction: Recovery progression

CloudWatch Extension for ROS

ROS Nodes
and topics

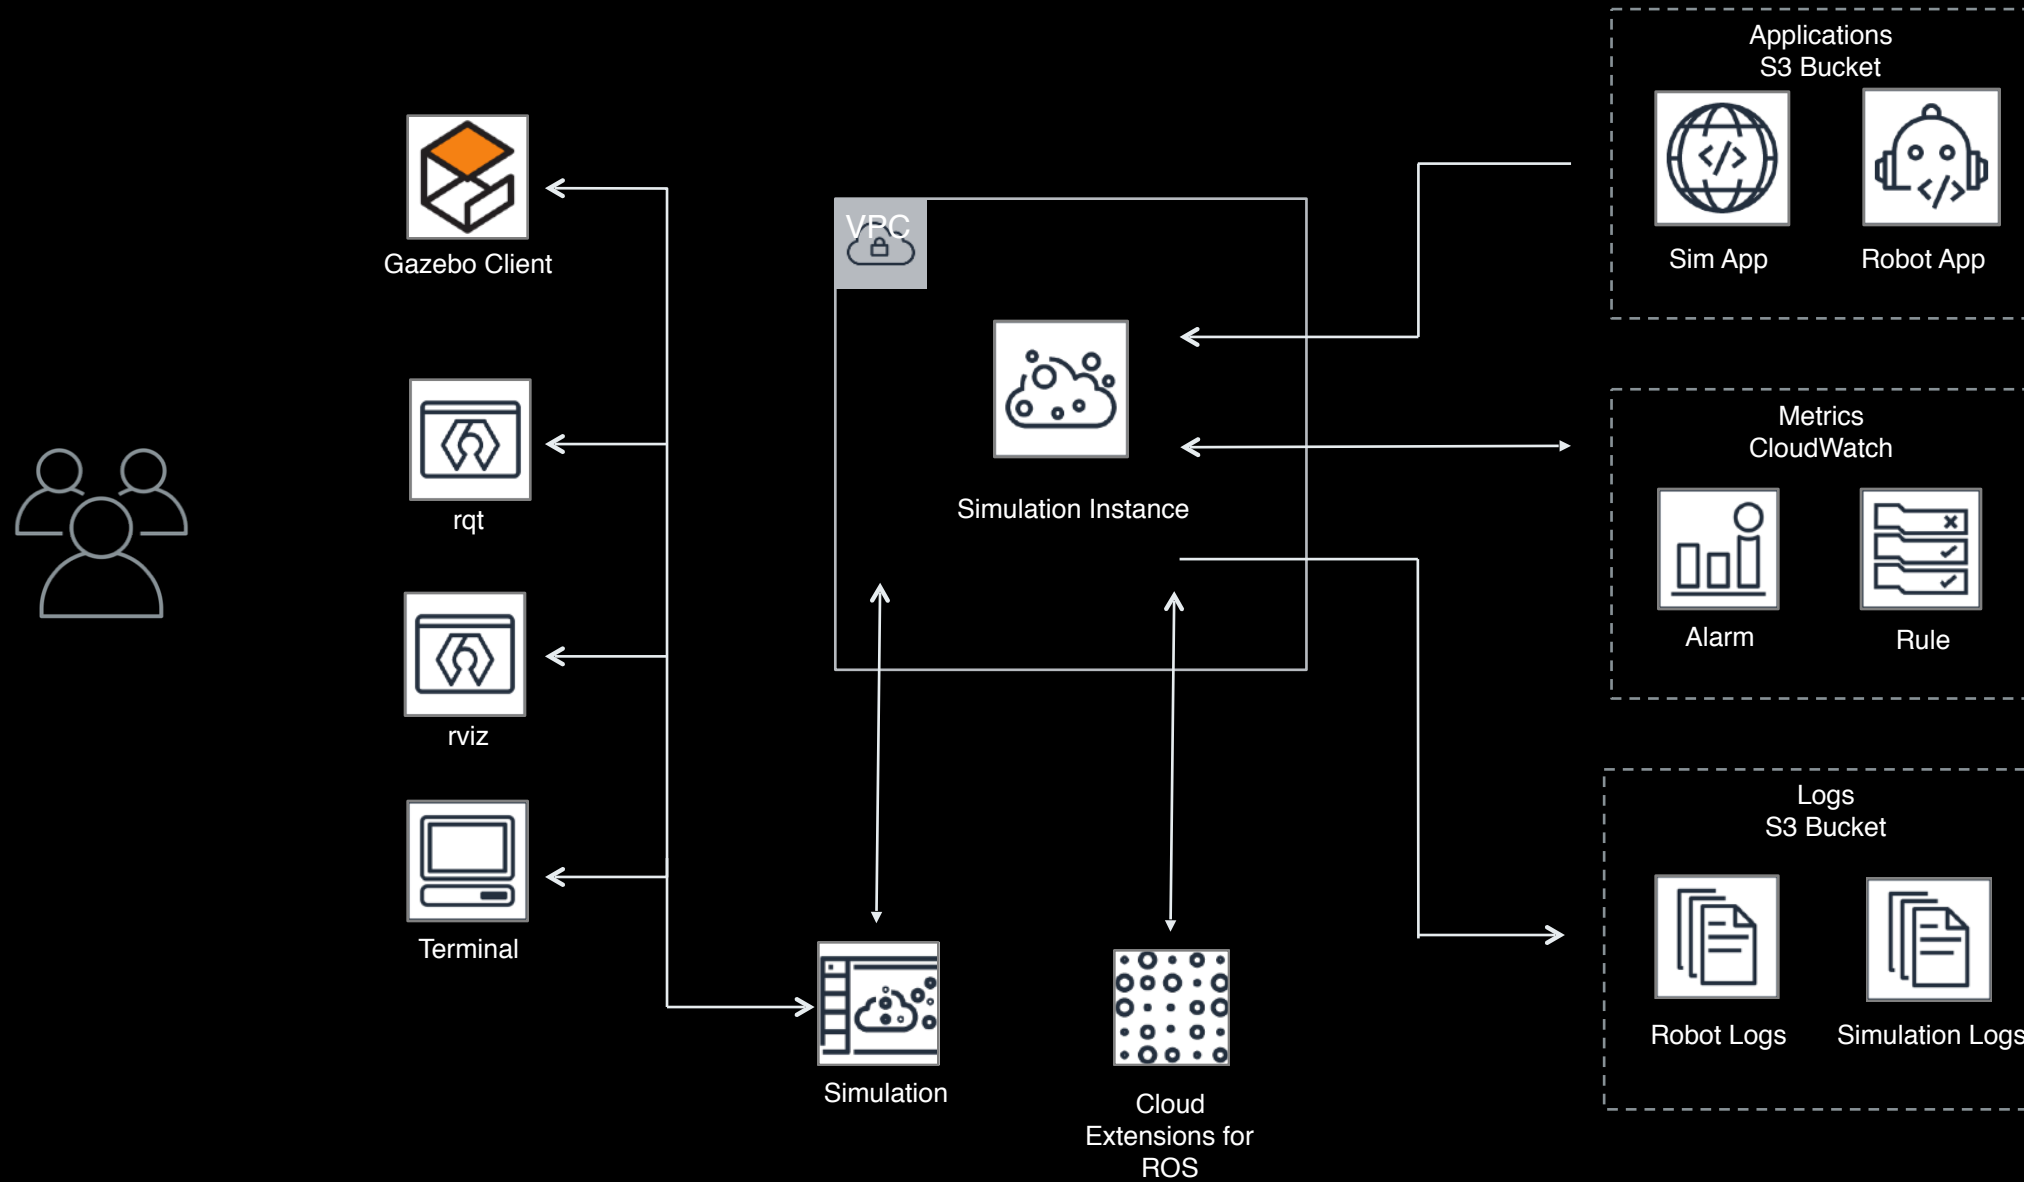

AWS RoboMaker Simulation

- ❖ Pre-built virtual 3D worlds or bring your own
- ❖ Zero infrastructure to provision, configure or manage.
- ❖ Run multiple simulations in parallel
- ❖ Auto-scale based on simulation complexity
- ❖ Pay-as-you-go simulation resource consumption

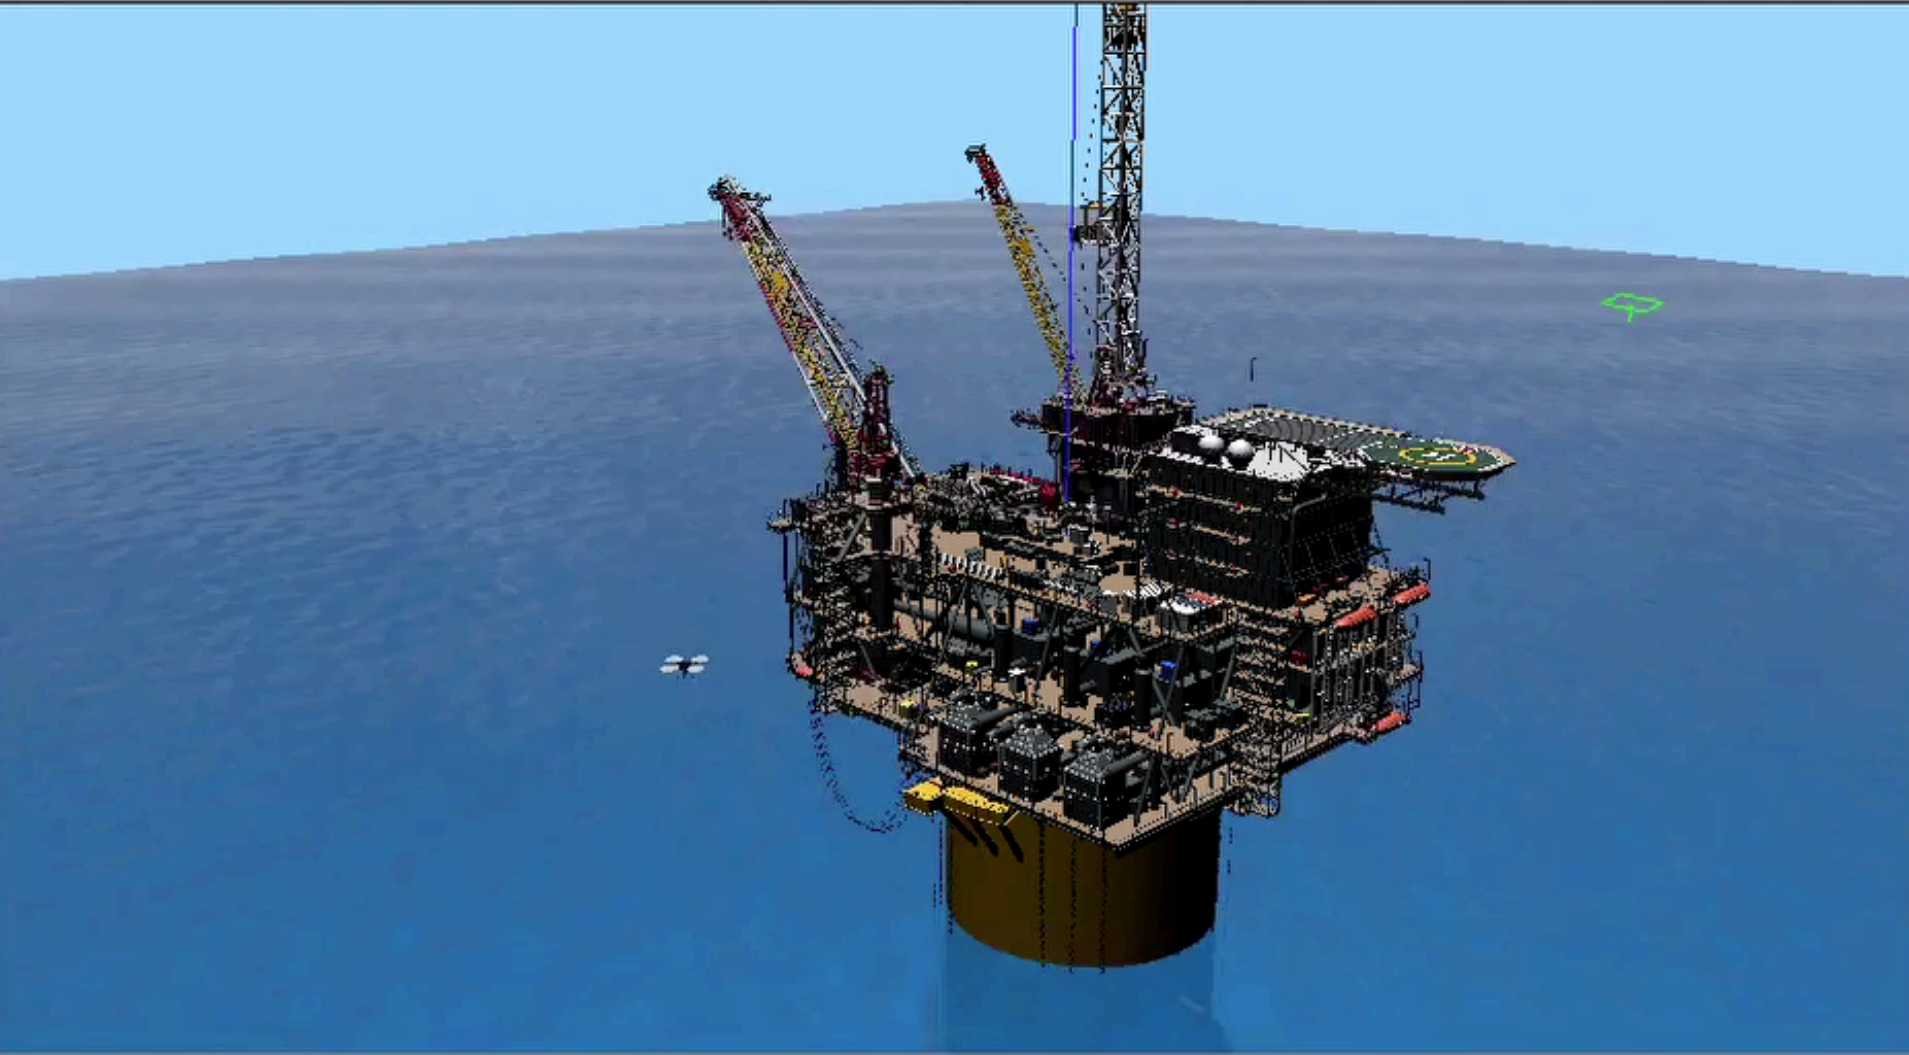

AWS RoboMaker Simulation

AWS RoboMaker

Successful Simulation to Real Transfer

One Click Sample Applications Available

The screenshot displays the AWS RoboMaker console interface. The top navigation bar includes the AWS logo, 'Services' and 'Resource Groups' dropdowns, a user profile 'Admin/gouravr-Isengard @ gar...', the region 'Oregon', and a 'Support' link. The main content area is titled 'https://us-west-2.console.aws.amazon.com/robomaker/home?region=us-west-2#sampleSimulationJobs' and features a sidebar menu on the left. Two sample applications are listed:

- Self-driving using reinforcement learning** [Info](#)
Teach a racecar to drive in a simulation through reinforcement learning using the Coach Reinforcement Learning Library, then deploy this capability to a robot. View the reward metrics in Amazon Cloudwatch Metrics to explore how the machine learning model improves over time. Customize your reward function to improve the machine learning algorithm used for training.
- Object following using reinforcement learning** [Info](#)
Teach a robot to track and follow an object through reinforcement learning in simulation using the Coach Reinforcement Learning Library, then deploy this capability to a robot. View the reward metrics in Amazon Cloudwatch Metrics to explore how the machine learning model improves over time. Customize your reward function to improve the machine learning algorithm used for training.

Below the sample applications, two informational boxes are displayed:

- RoboMaker sample applications include third-party software licensed under open-source licenses and is provided for demonstration purposes only.** Incorporation or use of RoboMaker sample applications in connection with your production workloads or a commercial products or devices may affect your legal rights or obligations under the applicable open-source licenses. Source code information can be found [here](#).
- RoboMaker sample simulation jobs run for 1 hour by default.** You should terminate the job once you finish evaluating it to avoid additional charges or free-tier usage.

JETSON - ROBOTICS

The Jetson Family

From AI at the Edge to Autonomous Machines

JETSON NANO
5 - 10W

Qualcomm® Robotics RB3 Platform

■

Qualcomm® Robotics RB3 Platform

Dedicated platform to build smart, power-efficient and cost-effective robots

- For large industrial and enterprise robots to small battery-operated one's with challenging power and thermal dissipation requirements.
- High-performance heterogeneous computing with Qualcomm® SDA/SDM845
- Qualcomm® Artificial Intelligence (AI) Engine for on-device machine learning
- Computer vision
- Vault-like security
- Wi-Fi and cellular connectivity (4G/LTE, CBRS and support for 5G)
- Supports flexible commercialization choices: dev board/kit, SOM, chip-on-board
- Linux, ROS, AWS RoboMaker

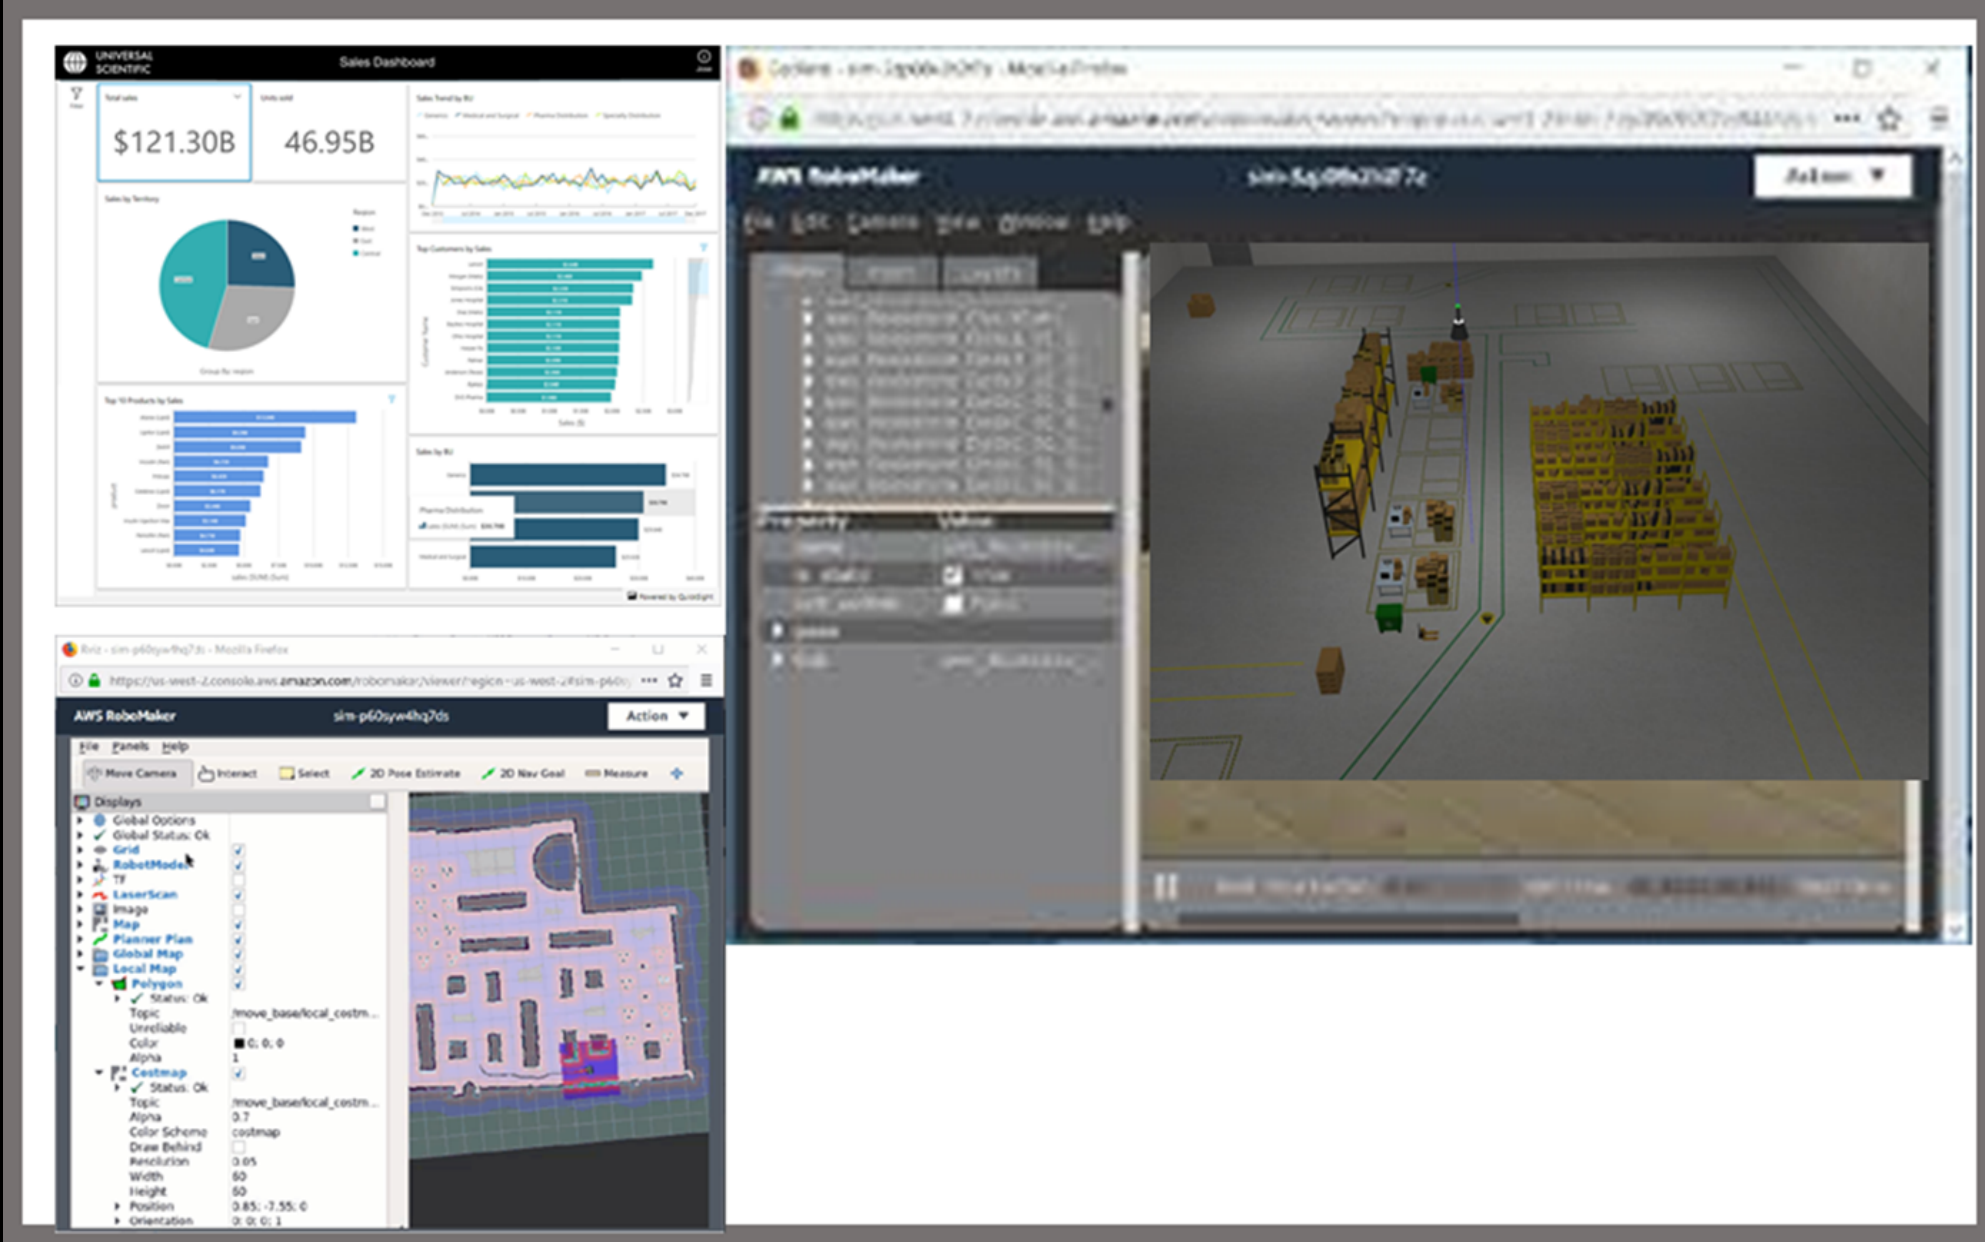

AWS RoboMaker

Rover “SwagBot” powered by AWS RoboMaker

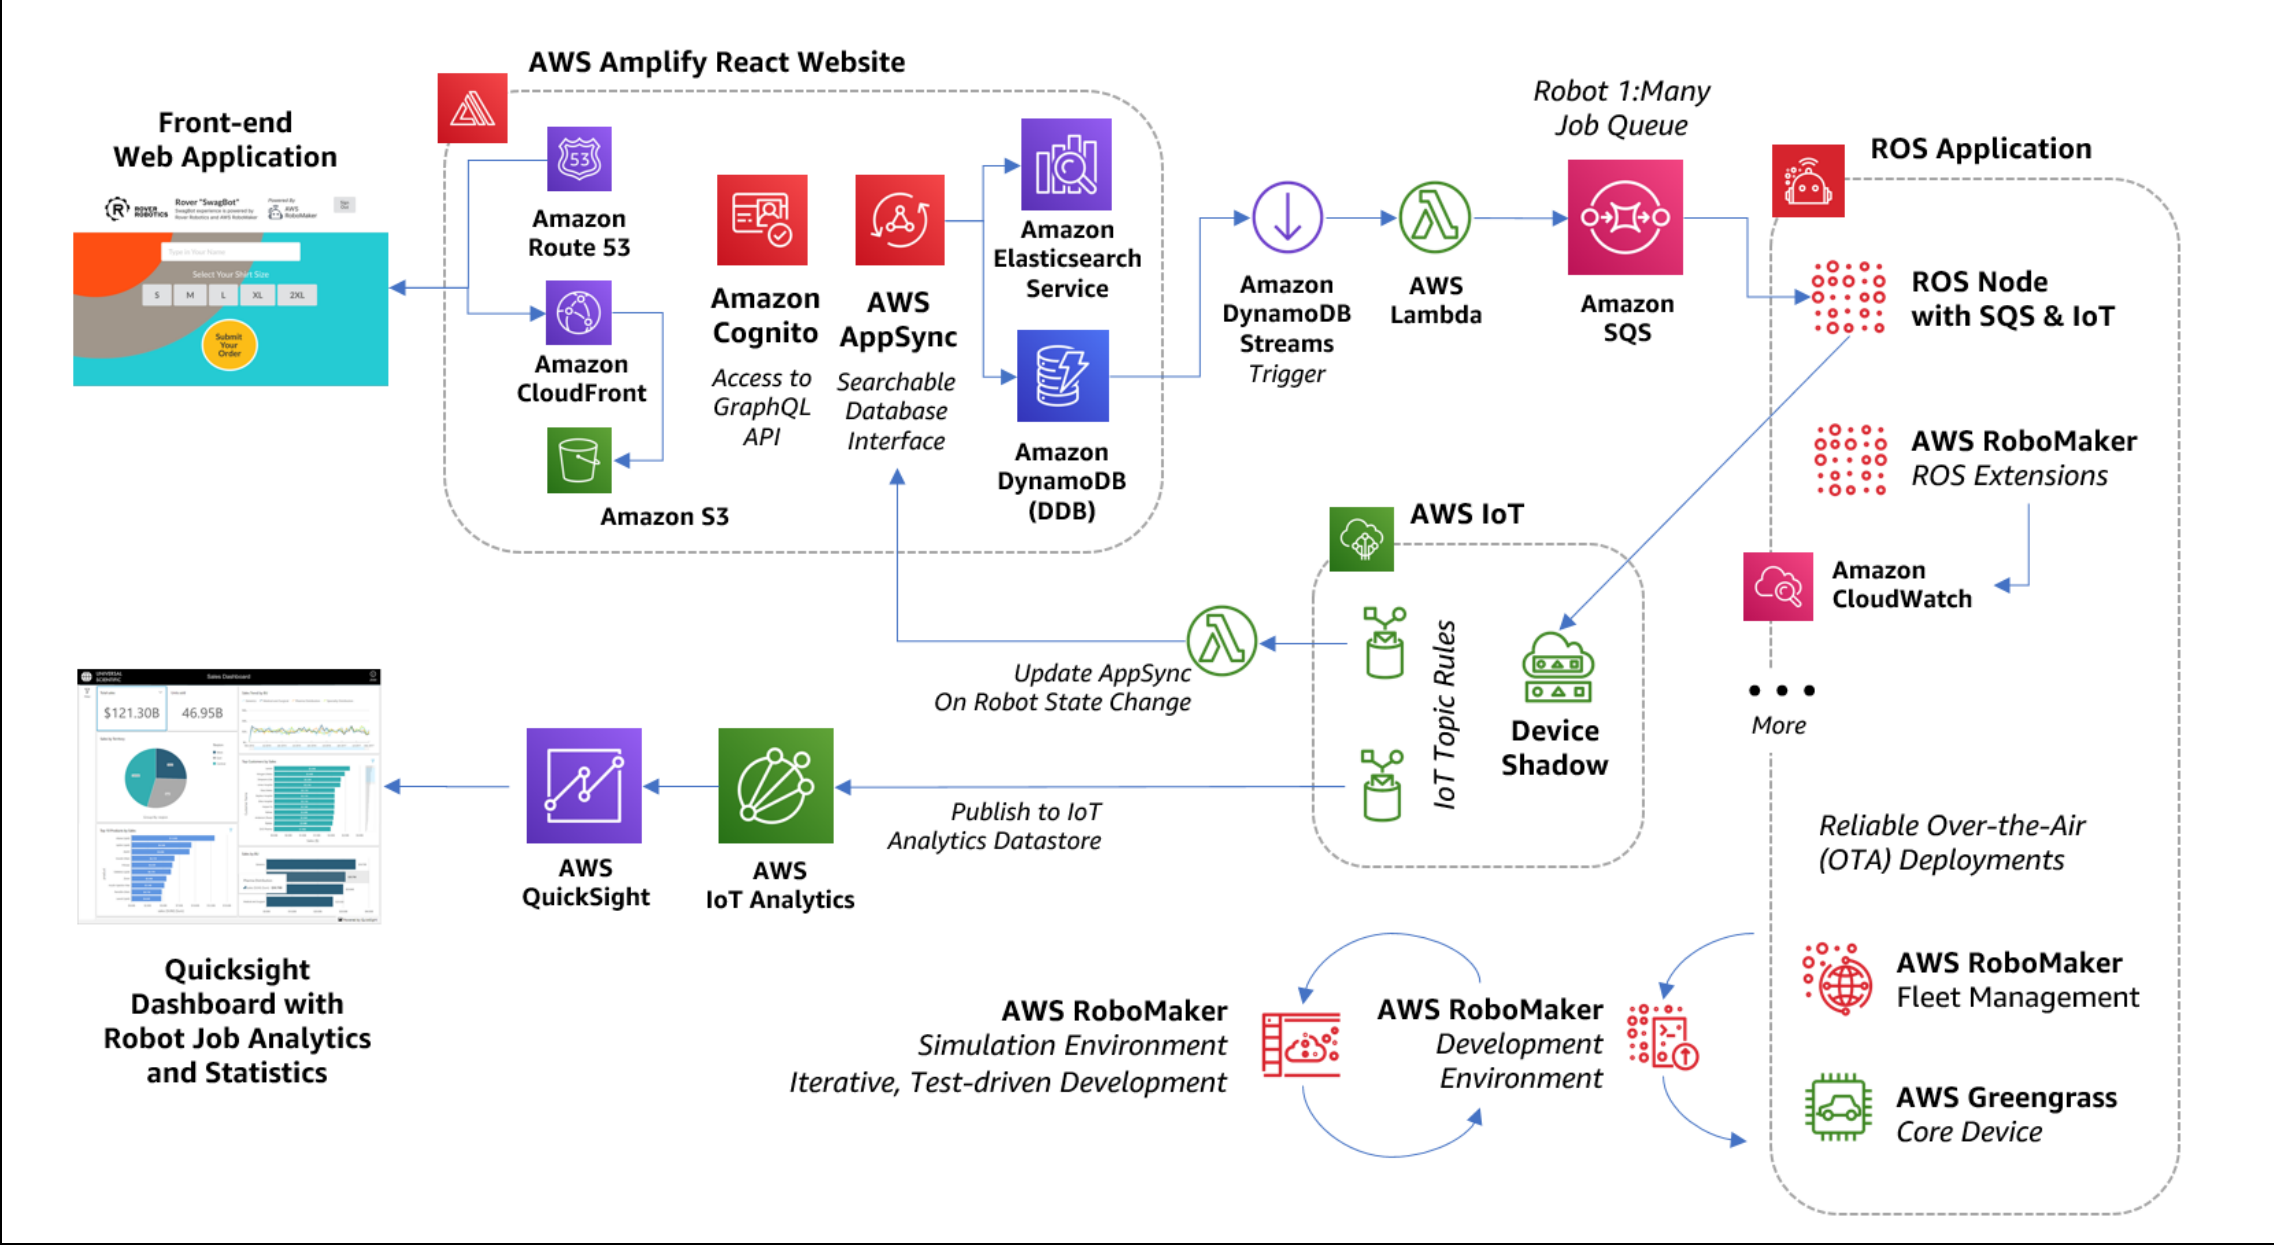

AWS RoboMaker

Rover “SwagBot” powered by AWS RoboMaker

Rover “SwagBot” powered by AWS RoboMaker

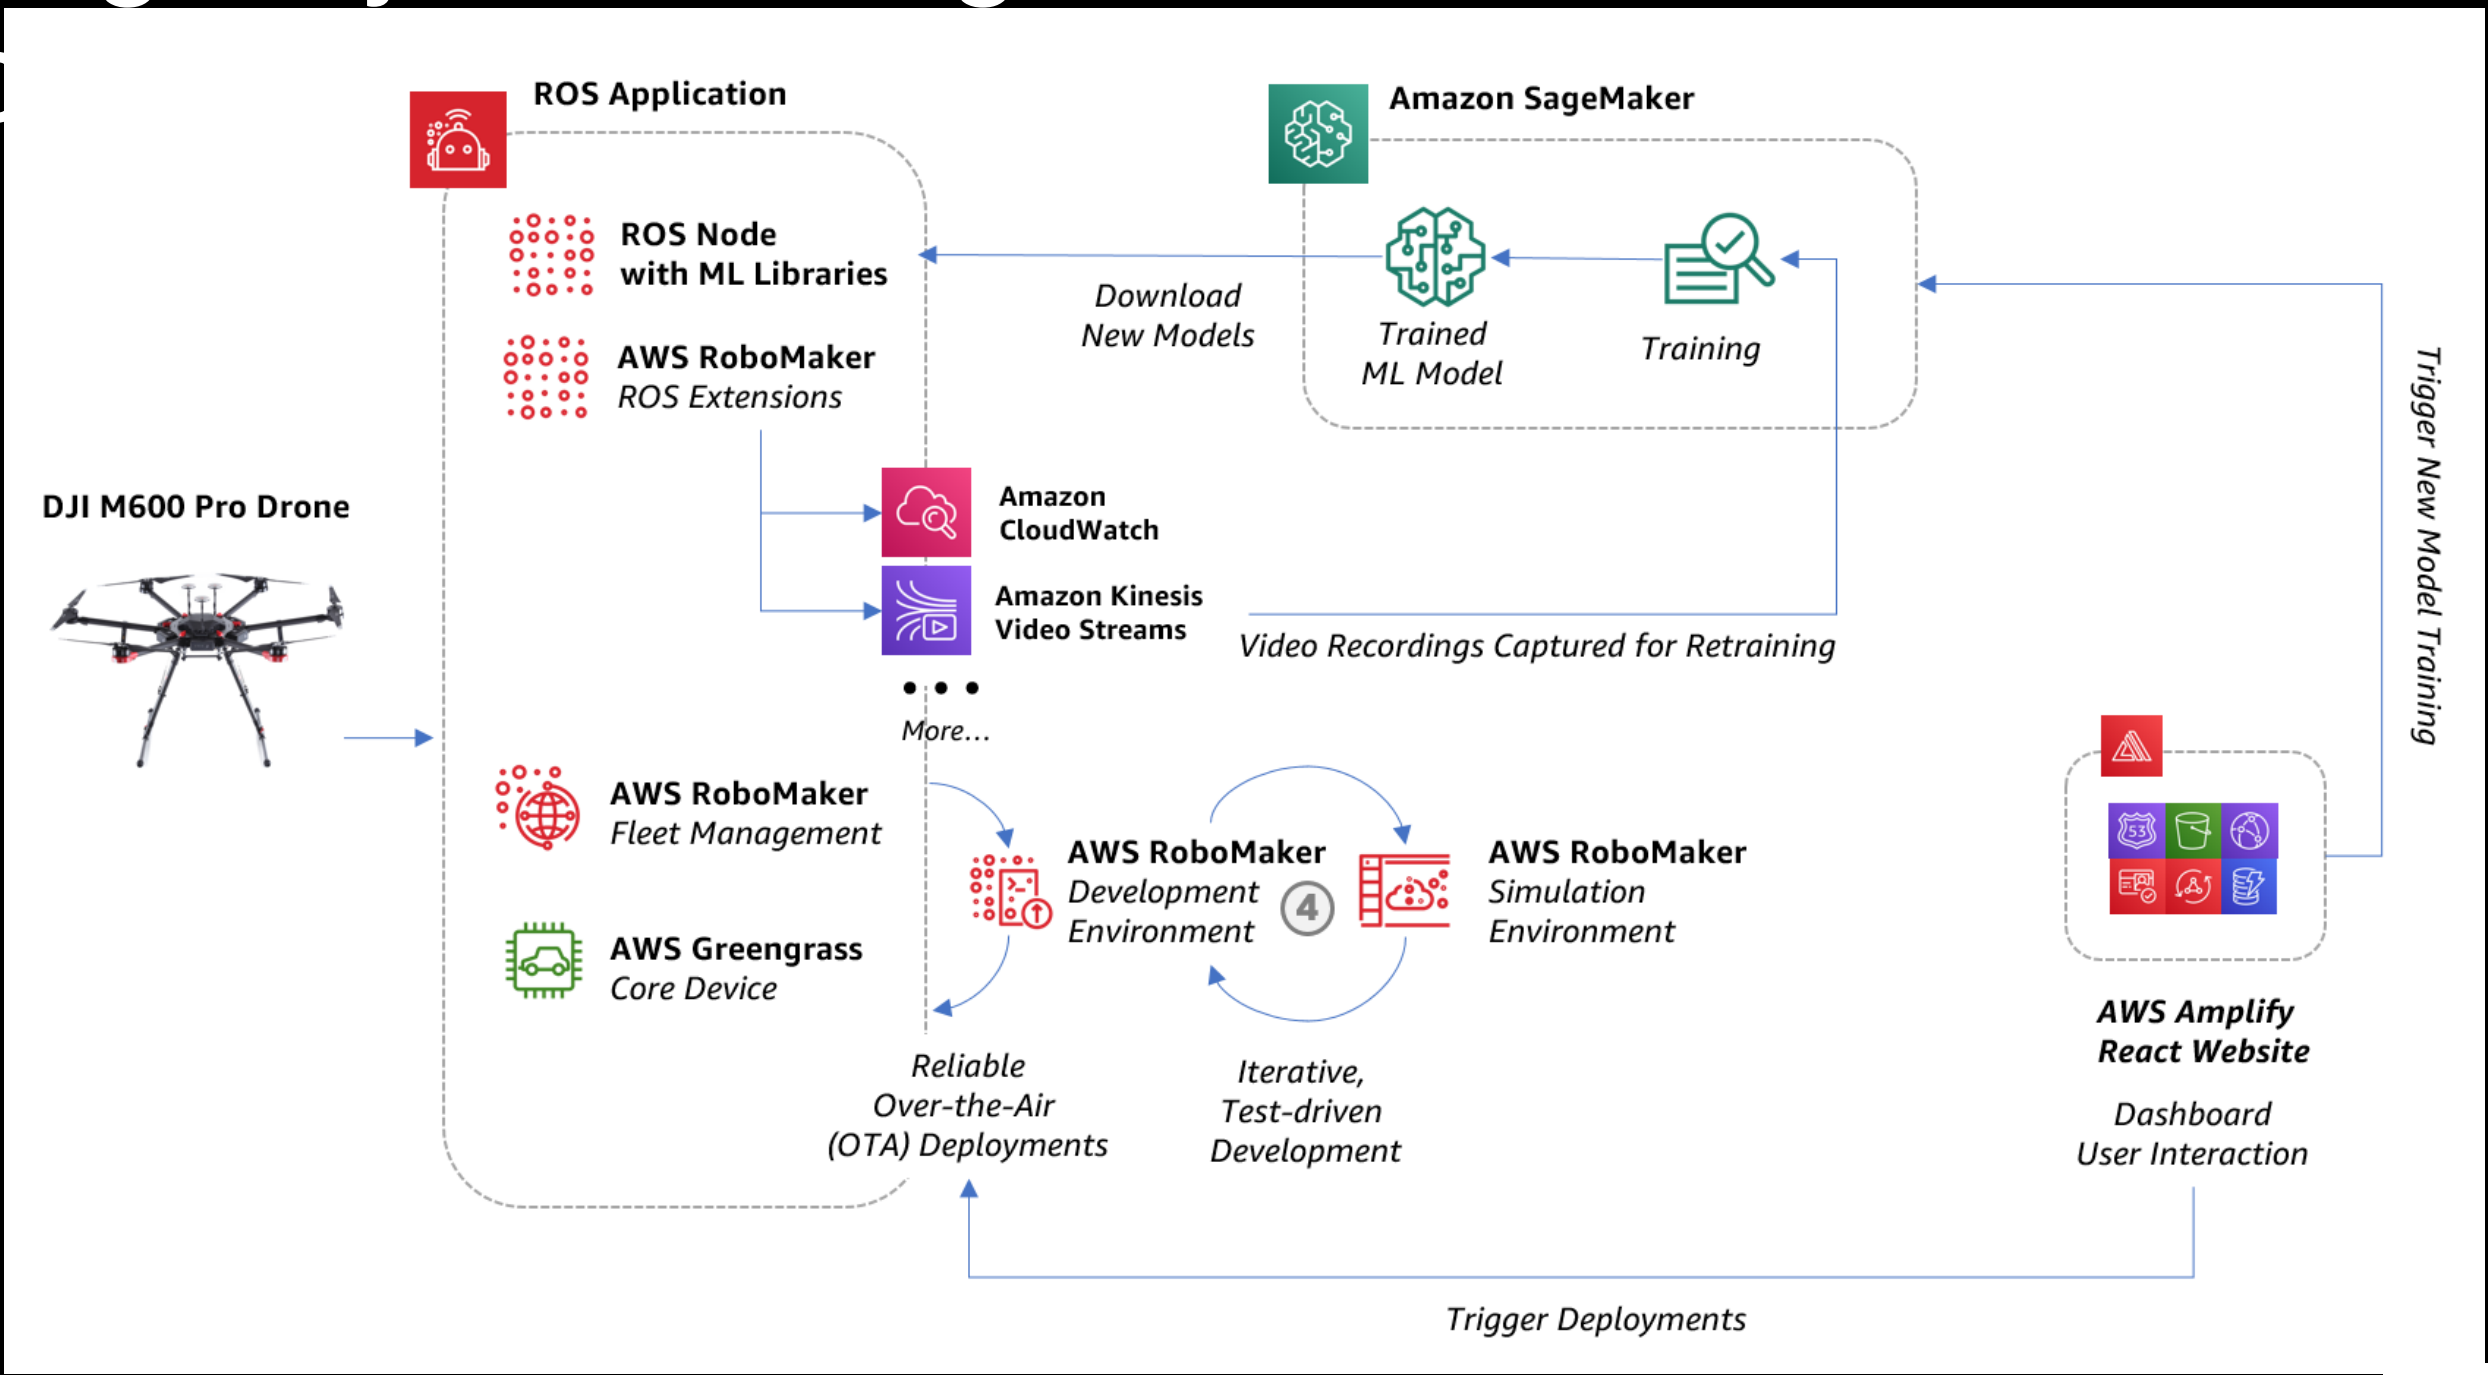

- ① The user requests a t-shirt by interacting with a static, client-side react website. The website is built using the **AWS Amplify CLI** and served through **Amazon CloudFront** and **Amazon S3**. Orders are stored in an **Amazon DynamoDB** database, which the application interacts with through a GraphQL endpoint using **AWS AppSync**.
- ② An **AWS Lambda** trigger on the **Amazon DynamoDB Streams** writes a message containing the retrieval job to an **Amazon Simple Queue Service (SQS)** queue.
- ③ The ROS application running locally on the Rover robot connects to the **Amazon SQS** queue and starts a retrieval job, reporting the state back to the **AWS IoT Device Shadow** associated with the **AWS Greengrass Core**.
- ④ An **AWS IoT Rule** triggers an **AWS Lambda** function on each status update, and invokes an **AWS AppSync** mutation. An **AWS AppSync** subscription in the web application automatically updates the dashboard with the new job status.
- ⑤ New robot features are developed using the **AWS RoboMaker** cloud-based IDE. During the development the new ROS code can be easily simulated in **AWS RoboMaker**.
- ⑥ Once the feature is ready, the code is integrated into git automation processes that use **AWS RoboMaker** simulation service to test various scenarios. Then, the code is reliably deployed over-the-air (OTA) to production robot fleets using **AWS RoboMaker** fleet management.

Emergency Monitoring Drones built on AWS

Robo

Education and Research Partners

Role of the Cloud in the Future of Robotics

1

DEVOPS for Robotics: code, test, deploy, monitor.

2

Intelligent cloud services can enhance local processing on the robot and can improve performance over time.

3

Simulation, combined with imitation and reinforcement learning can be used to program robot actuation.

4

Cloud services enable fleet management, coordination and remote processing for digital transformation.
